## Problem 1

**Exercise 1.5.3 – (b)**

Let us suppose that  $C$  contains neither  $\neg$  nor  $\perp$ . Now let us consider a formula  $\phi$  that contains the connectives  $\{\wedge, \vee, \rightarrow\}$ . If every atom of  $\phi$  is **T**, then  $\phi$  will be **T**. We can prove this by using the truth tables of each connective in the set  $\{\wedge, \vee, \rightarrow\}$  – in every single one, if all the atoms are **T**, then the formula will be **T**. The problem is that, considering only  $\{\wedge, \vee, \rightarrow\}$  as the set of connectives, we cannot express the formula  $\neg\phi$ . Thus,  $C$  must contain  $\neg$  or  $\perp$ .

**Exercise 1.5.3 – (c)**

The set  $\{\leftrightarrow, \neg\}$  is not an adequate set of connectives for propositional logic. This is because we cannot create  $\{\wedge, \vee, \rightarrow\}$  using only  $\{\leftrightarrow, \neg\}$ . We can prove this by showing that any formula using only  $\{\leftrightarrow, \neg\}$  will always have an even number of **T** and **F** in the truth table, and, therefore, we cannot create connectives such as  $\{\wedge, \vee, \rightarrow\}$  (that have an odd number of **T** and **F** values). The proof that  $\{\leftrightarrow, \neg\}$  will always have an even number of **T** and **F** in the truth table can be done by structural induction.

## Problem 2

Solving by hand:

$$\begin{aligned} a &= (a + 2b + 3c) - 2b - 3c \\ &= 7 - 2b - 3c \\ &= 7 - (b + 2c) - b - c \\ &= 7 - 3 - b - 1 \\ &= -b - 2c + 2c + 3 \\ &= -(b + 2c) + 2c + 3 \\ &= -3 + 2 \cdot 1 + 3 \\ &= 2 \end{aligned}$$
